in a Bubble of Fcam.

Orig Pub : Zh. prikl khimii, 1956, 29, No 9, 1323-1329

Abstract : Study of the process of absorption 7 of CO, by a solu-

tion of potassium carbonate (I) depending upon the basic factors. Experiments were conducted in a unit where absorption was effected in an individual bubble of foam candeonsequently the surface of phase contact could be determined by calculations. A study was made of the effect of addition of surface active substance, saponin, (II), on absorption kinetics, and it was found that with low concentrations of II x < 0.6 g/liter, there is observed a decrease in rate of absorption, and absorption

sov/56-34-5-31/61 Akhiyeter, A. I., Shishkin, L. A. On the Theory of Thermal Conductivity and Absorption of Sound AUTHORS: in Ferromagnetic Dielectrics (K teorii teploprovodnosti i pogloshcheniya zvuka v ferromagnitnykh dielektrikakh) TITLE: Zhurnal eksperimental noy i teoreticheskoy fiziki, 1958, Vol. 34, Hr 5, pp. 1267 - 1271 (USSR) PERIODICAL: In this paper the determination of the temperature dependence of the heat conductivity and of the absorption coefficient of sound in ferromagnetic dielectrics is investigated. In ferromagnetic dielectrics the elementary excitations are not only ABSTRACT; represented by phonons but also by spin waves. Therefore the investigation of the influence of the spin waves on heat conductivity and absorption of sound in these materials is of interest. The authors show that at low temperatures the heat conductivity of an unlimited ferromagnetic dielectric without admixtures is determined essentially by the interaction of the spin waves with each other and with the phonons. The dissipation function of the ferromagnetic dielectric will, if an external sonic field Card 1/4

On the Theory of Thermal Conductivity and Absorption SOY/56-34-5-31/61 of Sound in Ferromagnetic Dielectrics

at low temperatures is present, also be determined by the interaction of the spin waves among each other; it will be independent of the temperature. (In the case of common dielectrics it is inversely proportional to the temperature). The following elementary interaction processes in the system of the spin waves and phonons which are considered are the most important ones: Transformation of two phonons into one phonon, transformation of two spin waves into one spin wave, the scattering of a spin wave by a phonon, and the transformation of two spin waves into one phonon. Expressions for the probability of these processes are written down. Subsequently the authors write down and explain the kinetic equations for the distribution functions of the spin waves and phonons with regard to these interaction processes. These equations are specialized for low temperatures. Expressions for the heat currents, caused by the phonons and spin waves, are given. In the last section the absorption of sound in a ferromagnetic dielectric is investigated. On this occasion the deviations of the distribution functions of the phonons and spin waves from their equilibrium values must be found and the increase

Card 2/4

On the Theory of Thermal Conductivity and Absorption SOV/56-34-5-31/61 of Sound in Ferromagnetic Dielectrics

> of the entropy of the crystal, which is connected with these deviations, must be determined. The influence of the sound field on the phonons and spin waves is reduced to a change in the energy of the phonon and of the spin wave. At  $T\ll \Theta^2/\Theta_c$  the absorption of the sound is caused mainly by the spin waves. The authors express their gratitude to M.I. Kaganov for valuable discussions. There are 4 references, 3 of which are Soviet.

The Absorption of Sound in Ferromagnetic Dielectrica in a TITLE:

Magnetic Field at Low Temperatures (Pogloshcheniye zvuka v ferromagnitnykh dielektrikakh v magnitnom pole pri nizkikh

temperaturakh)

Zhurnal eksperimental noy i teoreticheskoy fiziki, 1958, PERIODICAL:

Vol. 35, Nr 1, pp. 286 - 287 (USSR)

According to a paper by Akhiyezer and the above mentioned ABSTRACT:

author (Ref 1) the absorption of sound in ferromagnetic dielectrica (which is caused by the internal friction in the system of the elementary excitations, phonons, and spin waves ) at low temperatures is principally determined by the spin waves, and it does not depend on temperature. The external magnetic field changes the relaxation time in such a system and also the temperature dependence of the absorption coefficient of sound. First, formulae are given for the relaxation times of spin waves and

phonons. According to Akhiyezer (Ref 2) the following

elementary processes are the most important: the conversion

The Absorption of Sound in Ferromagnetic Dielectrica in SOV/56-35-1-44/59 a Magnetic Field at Low Temperatures

of 2 spin waves into 1 spin wave, the conversion of 2 phonons into 1 phonon; and the scattering of spin waves by phonons. If there is an external magnetic field, the energy of the spin wave depends on the field strength and this dependence has the form  $\varepsilon_0$  + 2 $\beta$ H;  $\varepsilon_2$  denotes the energy of the spin wave without a magnetic field, H - the magnetic field strength,  $\beta$  - the Bohr magneton. This dependence implies a dependence of the relaxation times of the phonons and spin waves on the magnetic field. The relaxation times for the spin-spin interactions satisfy different relations for the cases of high and low values of 2βH/k T.k denotes the Boltzmann (Bol'tsman) constant and it holds that  $2\beta/\kappa \sim 10^{-4}$ . The formula for the abovementioned relations are given explicitly. The relaxation times of the spin waves and phonons with respect to the interaction with one another and of one phonon with another phonon are not modified by the existence of an external magnetic field. The formula for these relaxation times are given explicitly. For H/T  $\ll 10^4$  and T  $\ll \theta^2/\theta_0$  the dissi-

Card 2/4

The Absorption of Sound in Ferromagnetic Dielectrica in SOV/56-35-1-44/59 a Magnetic Field at Low Temperatures

pative function and the absorption coefficient of sound depend on the relaxation time. In this case the magnetic field intensifies the absorption of sound. For  $H/T \gg 10^4$  and  $T \ll \Theta^2/\Theta$  the spin-spin interaction has a low degree of probability and the greatest contribution to the dissipative function is made by the interaction of the spin waves with the phonons. For sufficiently strong magnetic fields the absorption of sound depends exponentially on temperature, but it does not depend on the field strength. In both of the above mentioned cases the phonons play a less important rôle in the absorption of sound. The author thanks Professor A.I.Akhiyezer, who suggested this topic to the author. There are 2 references which are Soviet.

Symmetrical Surface waves in a Helical Waveguide Immersed in a Ferrite Medium

in a radial direction. It is assumed that slow axially-symmetrical waves propagate in the system. The following special cases are considered: small gyrotropicity, large magnetic bias field, the system close to resonance and low magnetic permeability. The dispersion equations here derived are solved by a method of successive approximations. The dispersion curves for various values of the system parameters are given. The article concludes with the calculation of the power flux distribution in the system. There are 6 figures and 12 references: 9 Soviet (one of which is a translation from English) and 5 non-Soviet.

TITLE:

Unilateral wave propagation in helical waveguide

immersed in ferrite medium

PERIODICAL: Radiotekhnika i elektronika, Vol.6, No.1, 1961,

pp. 81-91

TEXT: The authors consider the previously observed but not satisfactorily explained phenomenon of directive propagation in a system consisting of a helix surrounded by a ferrite medium with an applied constant axial magnetic field. The actual directivity observed of 6:1 (Ref.2: J.A. Rich, S.E. Weber, Proc. I.R.E., 1955, 43, 1, 100) is higher than that predicted by elementary theory, which determines the degree of directivity from the eccentricity of the magnetic field vector ellipse in the plane perpendicular to the constant magnetic field. Rich and Weber (Ref. 2) proposed that the divergence between the experimental results and the predictions of the elementary theory are caused by the influence of the ferrite permeability on the magnetic Card 1/3

dielectric loss.

Unilateral wave propagation in ... vector ellipse eccentricity. The present authors have previously (Ref. 3) published an electrodynamic solution of the problem for lossless systems. The present note solves the same problem for systems with dielectric and magnetic losses having a ferroresonant character. The analysis predicts directivities of up to 8:1, a result useful for the design of ferrite attenuators for TWT-amplifiers. On the basis of the formulae obtained curves have been calculated which permit the following conclusions. (1) The directivity has a maximum in the neighbourhood of a resonant frequency, of the order of 8:1. (2) The dependence of attenuation of magnetization for a given magnetic field is weak. (3) At frequencies equidistant from resonance the attenuation increases as the magnetic field decreases. (4) In the presence of high dielectric losses frequency bands are possible in which the backward attenuation is lower than the forward attenuation. Thus the dependence of attenuation ratio and of absolute attenuation on the dielectric loss have the same character, is necessary to take ferrites with the lowest possible

Surface spin waves

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiotekhnika,

v.5, no.5, 1962, 557-560

The paper considers electromagnetic-spin waves in ferromagnetics which pass into surface electromagnetic waves at low frequencies and surface spin waves at high frequencies. TEXT: waves due to exchange and magnetic-dipole interactions and electromagnetic waves arising from eddy-fields are limiting cases of the same phenomenon. The author considers these for the case of a ferrite with a cubic crystal lattice magnetised parallel to the surface (ferrite filling an infinite half-space). Real, imaginary and complex solutions for the propagation constant correspond to propagated and attenuated waves, and propagation of two forward and two backward waves with periodic redistribution of energy between individual wave types, respectively.

PITLE: Magnetization of ferremagnetics with two regnetic sublattices

SOURCE: Fizika metallov i metallovedeniye, v. 17, no. 5, 1964, 664-671

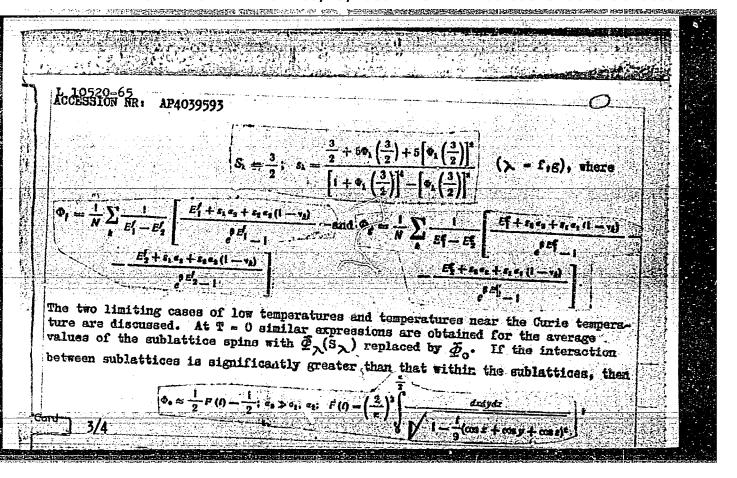

TOPIC TAGS: ferromagnetic structure, magnetization, temperature dependence, Curie temperature

ABSTRACT: The magnetization is considered of a ferromagnetic with two magnetic sublattices and arbitrary spin at the lattice points of each sublattice. Considering only spin exchange interactions and energy of the atoms in an external magnetic field ?, the Hamiltonian of the ferromagnetic is given by

$$H = -g_1 \mu B \sum_{i} S_i^2 - g_2 \mu B \sum_{i} S_g^2 - \frac{1}{2} \sum_{f_1 f_2} I_{f_1} (f_1 - f_2) S_{f_1} S_{f_2} - \frac{1}{2} \sum_{f_2 f_3} I_{f_3} (g_1 - g_2) S_{g_1} S_{g_2} + \sum_{f_2 f_3} I_{f_2} (f - g) S_{f_1} S_{g_2}, \text{ where } S_g \text{ and } S_g \text{ are the atomic spins.}$$
In the Start and second relationship

in the first and second sublattice,  $I_{11}$ ,  $I_{22}$ ,  $I_{12} > 0$  are the respective exchange integrals,  $\mu$  is the Bohr magneton,  $g_1$  and  $g_2$  are the Landé factors, and the

## ACCESSION NR: AP4039593 subscripts f and g refer respectively to the first and second sublattices. It is shown that the spectrum of elementary excitations is found from $E'_{1,2} = -\frac{1}{2} \left[ \sigma_2(s_1 - s_1) + (s_1 \alpha_1 - s_1 \alpha_2)(v_{k-1}) \right] \pm \frac{1}{2} \left\{ \frac{1}{4} \left[ \sigma_3(s_1 - s_2) + (s_1 \alpha_1 - s_1 \alpha_2)(v_{k-1}) \right]^{\frac{1}{2}} + \sigma_3(1 - v_k) \times \left[ \times (s_1^2 \alpha_1 + s_2^2 \alpha_2) + s_1 s_2 \left[ \alpha_1 \alpha_1 (1 - v_k)^3 + \alpha_2^2 (1 - v_k^2) \right]^{\frac{1}{2}} \right], \text{ where } B = 0 \text{ for simplicity and } \alpha_1 = \sum_{i=1}^{l} I_{11} (i - I_{11}); \alpha_i = \sum_{i=1}^{l} I_{21} (g - I_{21}); \alpha_i = \sum_{i=1}^{l} I_{21} (g - I_{21}); \beta_1 = \langle s_1^2 \rangle : s_2 = -\langle s_2^2 \rangle : s_3 = -\langle s_2^2 \rangle : s_4 = \langle s_1^2 \rangle : s_$

TITLE: Contribution to the theory of coherent amplification of magnetostatic	
oscillations by an electron beam	
SOURCE: IVUZ. Radiofizika, v. 8, no. 5, 1965, 942-947	
TCPIC TAGS: ferrite, magnetic resonance, electron beam, coherent scattering	,
ABSTRACT: This is a continuation of earlier work by one of the authors (Bar'yakh-	
tar, with A. I. Akhiyezer and S. V. Peletminskiy, Phys. Letters v. 4, 129, 1963	
and ZhETF v. 45, 337, 1963; with Z. Z. Makhmudov, ZhETF v. 47, 593, 1964), who showed that the spin waves can be coherently amplified in infinite ferro- and anti-	
ferromagnets by a beam of charged particles. The present article deals with the	
interaction between an electron beam and magnetization oscillations in a finite	
magnet, where the shape of the body affects the spin-wave spectrum. Only the principal natural oscillation modes (Walker Modes, Phys. Rev. V. 105, 390, 1957),	
which are extensively used in microwave electronics, are considered, and exchange

L 4969-66 ACC NR: AP5026709

interaction is neglected. The authors determine the increments of the fundamental modes of the magnetostatic oscillations in a ferrite plate and show that the increment reaches a maximum when one of the resonant conditions is satisfied:  $\omega = \beta V_0 - \omega_H$  ( $\omega_H$ - frequency of the magnetostatic oscillations of the plate, v-beam velocity,  $\beta$ --wave vector). The increment is proportional to the square root of the charge density in the beam. The fields decrease outside the plate exponentially, since the beam particles participating in the coherent amplification of the magnetostatic oscillations are those located at a distance of the order of  $1/\beta$  from the surface of the plate. For frequencies on the order of  $10^{-10}$  sec<sup>-1</sup>, the increment has an approximate value  $10^{-3}$ . Orig. art. has: 19 formulas.

TITLE: Device for suppressing radio interference. Class 21, No. 149478

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 14, 1965, 127

TOPIC TAGS: radio noise, interference reduction

ABSTRACT: This Author Certificate presents a device for suppressing radio interference caused by high frequency oscillators containing resonance circuits tuned to the interference frequency. To increase the effectiveness of interference suppression mainly at the fundamental frequency with asymmetric loads, reactive elements, connected between the oscillator case and the main leads, are used. The sign of the susceptance of the reactive elements is opposite to the sign of the internal susceptance of the oscillator for the in-phase component of the output current.

TITLE: Probability of revealing dislocations by a condensation method

SOURCE: Fizika tverdogo tela, v. 9, no. 1, 1967, 167-170

TOPIC TAGS: crystal dislocation phenomenon, electric measurement, vapor condensation, condensation nucleus, crystal surface, Sociom CHLOPIOE

ABSTRACT: The authors advance a hypothesis that dislocations can be observed on the surface of a crystal by means of the electric charge of the dislocations (the condensation method). The method is based on the preferred nucleation of microscopic droplets in saturated liquid vapor on the electric charges. Thest of this method were made on NaCl crystals in an atmosphere of concentrated hydrochloric acide, and affirmative results were obtained. Dislocations could not be revealed in the same atmosphere on LiF crystals, but the morphology of the surface of these crystals was fixed. In the case of NaCl, various tests aimed at checking on the reproducibility of the method were also made and confirmed its feasibility. Inasmuch as the dimensions of the drops produced on the surface of the crystal are much smaller than etch pits, the method has somewhat better resolution than etching, especially at high dislocation densities. This selective arrangement of the drops makes it possible to

TITLE: Objectives in Creating a Reliable and Safe Power Supply to Coal Mines

PERIODICAL: V sb.: Sovershenstvovaniye gibkikh shlangovykh kabeley. M.,

1958, pp 43-50

ABSTRACT: A mechanically damaged cable in a mine must be quickly cut off, in less than 2 millisec, to prevent fault dislocation. The energy stored in the inductance of motors, etc., should be dissipated. The most rational method is to shortcircuit the phases and subsequently have them cut off by a relay protective system. Construction of a short-circuiter with a permanent magnet and disk springs is described. On energizing the coil of the magnet, that produces a demagnetizing field, the contacts close in 1.6 millisec. The contact spacing is 2 mm. To limit the short-circuit current, a rupturing device using the explosion energy can be introduced between the transformer and the short-

Card 1/2

Objectives in Creating a Reliable and Safe Power Supply to Coal Mines

circuiter. Initially, a current-limiting arc is formed in the circuit-breaker; then, in one millisec, the line is short-circuited. To register the moment of the cable mechanical damage in order to energize the coil, cable constructions have been developed that have individual shields around the cable principal cores (single-shield cable) or one or two shields made of semiconducting rubber. A drawing is presented of a shielded cable made by the Crompton Company with a metal shield that ensures quick off-switching but has an insufficient flexibility. The single-shield cables are most promising.

Protection of Alternating-Current Machines From Internal Shorts in the Stator Winding (Zashchita mashin peremennogo toka ot

vnutrennikh zamykaniy v obmotke statora)

PERIODICAL:

Elektrichestvo, 1958, Nr 10, pp 57-59 (USSR)

ABSTRACT:

This is an investigation of a simple and reliable protection against shorts a the stator winding, which can be used in place of a differential protection. This protection operates on the principle of the utilization of the magnetic coupling between the stator end connectors and the separately mounted protection coil. In order to demonstrate the working of this protection three modes of operation of a synchronous generator with fractional (drobnyy) stator winding partition are investigated:no-load, load and short circuit in the stator winding. The test runs showed that a protection adjusted in the way described operates selectively to all phase-to-ground and phase-to-phase faults. An exception is only the case of an equal number of windings being short-circuited in each phase of the stator winding. The protection advanced in this paper does not eliminate the necessity to establish a phase-to--ground protection in supply systems with contact-to-ground cur-
